# **INTERIM SUMMARY REPORT ON RISK ADJUSTMENT FOR THE 2020 BENEFIT YEAR**

**Published: March 31, 2021**

## I. Background

Section 1343 of the Patient Protection and Affordable Care Act (ACA) establishes a permanent risk adjustment program to provide payments to health insurance issuers that offer plans that attract higher-than-average risk enrollees, such as those with chronic conditions. These payments reduce the incentive for issuers to structure their plan benefit designs or marketing strategies to avoid such enrollees and lessen the potential influence of risk selection on the premiums that plans charge. In response to stakeholder feedback, the Department of Health and Human Services (HHS) began releasing an interim summary report to provide issuers and states with additional information on the progress of the risk adjustment program for the applicable benefit year prior to publication of the final report.

The risk adjustment methodology developed by HHS is based on the premise that premiums should reflect differences in plan benefits, quality, and efficiency rather than the health status of the enrolled population. The HHS-operated risk adjustment methodology determines each plan's risk adjustment transfer amount based on the actuarial risk of enrollees, the actuarial value (AV) of coverage, utilization, the cost of doing business in local rating areas, and the effect of different cost-sharing levels on utilization. For the 2020 benefit year, HHS applied this methodology in all 50 states and the District of Columbia.

This interim summary report on risk adjustment is based on issuers submitting at least 90% of three quarters of claims data and 90% of enrollment data for the 2020 benefit year. In the 2018 benefit year, HHS introduced the high-cost risk pool (HCRP) within the HHS-operated risk adjustment methodology, which reimburses issuers for a portion of each enrollee's aggregated plan paid amounts that meet certain parameters. As in the 2018 and 2019 interim reports, HCRP interim estimates have not been included because we expect that many issuers will submit their more expensive and complicated claims towards the end of the data submission period.

## II. Description of Data

As described in the November 25, 2020, "Evaluation of EDGE Data Submissions for the 2020 Benefit Year" bulletin,<sup>1</sup> HHS evaluated whether issuers provided access to EDGE server data sufficient for HHS to calculate and release an interim summary risk adjustment report for each state and the District of Columbia. HHS evaluated each issuer's data to determine if the issuer loaded at least 90% of its enrollment data for the full 2020 benefit year, and 90% of its claims data linked to enrollees (i.e., non-orphaned medical and pharmacy claims data) for the first three quarters of the benefit year (the data "quantity" evaluation). HHS also evaluated each issuer's EDGE server data to investigate outliers using a number of criteria (the data "quality" evaluation). If an issuer had a specific data outlier, the issuer was provided an opportunity to explain the outlier status. If the outlier was determined to be a true unresolved data quality issue, or if the issuer submitted no explanation, the issuer failed the data quality evaluation. As described in the bulletin, HHS will issue interim risk adjustment summary information for a state and the District of Columbia *only* if all credible issuers in that state passed both data quantity and

quality thresholds.<sup>2</sup> For the 2020 benefit year risk adjustment interim summary results, all 50 states and the District of Columbia are eligible for inclusion in the interim risk adjustment report.

The data displayed in this report are preliminary. Final risk adjustment data may differ and therefore result in significantly different magnitude and direction of the transfers from the data presented in this report. Because an issuer's risk adjustment transfer amount is dependent on the data submitted by other issuers within a state market risk pool, a stable risk score for an issuer between interim and final risk adjustment may not reflect a stable risk adjustment transfer amount. In addition, many issuers submitted more than the required threshold amount described above. The final risk adjustment transfer results and final state average calculations, based on issuers' final data submissions, may diverge from the data patterns reflected in this report.

The risk scores provided in this interim risk adjustment report will not necessarily be predictive of final 2020 benefit year risk adjustment risk scores. If an issuer wishes to use this interim information to assist in estimating the 2020 benefit year risk adjustment transfer amounts, it should do so with caution and in combination with other significant data. In particular, smaller issuers may experience a wider degree of variation, given the impact larger issuers have on transfers within a state market risk pool.

However, the data released in this report may be useful to issuers seeking additional information about the progress of the risk adjustment program prior to publication of the annual summary report, especially for those that participate in other regulatory programs that may have earlier submission deadlines, such as rate review for certain states. This report also contains data, such as billable member months and statewide average premiums, which may have utility beyond risk scores or risk adjustment.

### **III. Comparison of Interim and Final Risk Adjustment Results for the 2019 Benefit Year**

As we discussed in the [\*Summary Report on Permanent Risk Adjustment Transfers for the 2019 Benefit Year\*](#), we conducted additional analysis comparing the 2019 benefit year interim and final risk adjustment results to examine predictability and variation.<sup>3</sup>

For the 2015 benefit year, the first year HHS provided interim risk scores, 20 states plus the District of Columbia received interim risk adjustment results; the following year, 48 states plus the District of Columbia received interim results.<sup>4</sup> Since the 2017 benefit year, all 50 states plus the District of Columbia have received interim results, marking a significant improvement in the quantity and quality of issuer data submissions. In addition, preliminary regression modeling

---

<sup>2</sup> Issuers were deemed credible if they had at least 0.5% market share in a state.

<sup>3</sup> Available at <https://www.cms.gov/CCIIO/Programs-and-Initiatives/Premium-Stabilization-Programs/Downloads/RA-Report-BY2019.pdf>.

<sup>4</sup> Massachusetts operated a state-based risk adjustment program for the 2014 through 2016 benefit years; therefore, the Commonwealth was not eligible for inclusion in the interim report issued by HHS for these benefit years. HHS began operating risk adjustment in all states (including Massachusetts) and the District of Columbia starting with the 2017 benefit year.

based on data from benefit years 2017-2019 suggests a strong predictive relationship between total transfers and risk scores from interim to final. This predictive relationship reflects and depends on high quantity and quality data early in the data submission process to provide reliable estimates prior to final data submission that can be used in combination with other significant data for issuers' rate setting and financial forecasts.

We compared the national data quantity completion rate at the data submission deadlines for the interim reports for the 2019 and 2020 benefit years, which were determined by comparing each issuer's EDGE server data submission to their final baseline representing the full year of reported data for 2019 and 2020. For the 2019 benefit year interim risk adjustment estimates, we calculated a data completion of 92.0% as of the interim deadline of January 16, 2020. For the 2020 benefit year interim risk adjustment estimates, we calculated a data completion of 90.0% as of the interim deadline of January 14, 2021.

We note that depending on issuers' data quantity submissions beyond three quarters of data in a given state market risk pool, issuers' relative portion of data submitted by the interim deadline, issuers' market share, and data quality once final data has been loaded, the estimates from interim to final could still change significantly. For example, the regression modeling indicated that predictability of final risk adjustment results from interim results in a given state market risk pool can be drastically reduced by a single issuer outlier with incomplete or erroneous data, even one with relatively few enrollees.

In addition to interim risk scores not reflecting the final risk scores, risk score changes over benefit years do not necessarily reflect changes in population health risk as risk score changes year over year are also affected by changes in plan enrollment (metal or cost sharing), coding practices, and the risk adjustment methodology. We estimate that changes in risk adjustment model updates from the 2019 to 2020 benefit years will result in an overall risk score decrease after final 2020 benefit year risk scores are calculated, with most of this decrease being due to changes in recalibration data with the addition of a second year of enrollee-level EDGE data to the model recalibration.<sup>5</sup> Since issuers continue to update their enrollment and claims data, it is difficult to determine the impact of the COVID-19 pandemic and increased telehealth use on risk score changes at this time. **Therefore, risk score differences indicated below in Table 1 comparing interim 2020 and final 2019 data submission are not comparable due to data completeness and model differences by year.**

**Table 1. Percent Change in Select Risk Adjustment Variables, 2019 Final to 2020 Interim<sup>6</sup>**

	<b>INDIVIDUAL MARKET<sup>7</sup></b>		<b>SMALL GROUP MARKET</b>	
	<b>Mean</b>	<b>Standard Deviation</b>	<b>Mean</b>	<b>Standard Deviation</b>
Plan Liability Risk Score	-14.8%	3.2%	-11.2%	4.0%
Billable Member Months	4.4%	6.8%	-4.8%	8.3%
Monthly Premiums	-3.0%	6.8%	4.0%	3.4%
Age Rating Factor	0.0%	0.6%	0.3%	0.3%
Actuarial Value	-0.4%	0.8%	0.2%	0.4%

<sup>6</sup> Percent change in risk score is calculated based on unadjusted risk scores. Mean percent changes are weighted by billable member months.

<sup>7</sup> Individual market includes the Massachusetts and Vermont merged markets.

#### IV. HHS-operated Risk Adjustment Program State-specific Data

Included in Table 2 are the key elements of the risk adjustment state payment transfer formula for states that met the credibility requirements.

**Table 2. Description of Risk Adjustment Data**

DATA ELEMENT	DESCRIPTION
<b>State Average Monthly Premium</b>	The state average premium for a state market risk pool is the weighted average monthly premium for the state market risk pool, weighted by plan share of statewide enrollment in the state market risk pool. A 14% administrative cost adjustment is applied to the state average monthly premium. This value is used in the state payment transfer formula calculations of risk adjustment payments and charges.
<b>State Average Monthly Premium Before Adjustment</b>	The state average premium for a state market risk pool is the weighted average monthly premium for the state market risk pool, weighted by plan share of statewide enrollment in the state market risk pool before the 14% administrative cost adjustment is applied. This value is for informational purposes only and is not used in the calculation of risk adjustment payments and charges.
<b>State Average Plan Liability Risk Score (PLRS)</b>	The state average PLRS is calculated as the summed products of PLRS and billable member months for all plans within the state market risk pool divided by total billable months for all plans within the state market risk pool.
<b>State Average Allowable Rating Factor (ARF)</b>	The state average ARF is calculated as the summed products of ARF and billable member months for the plans within the state market risk pool divided by total billable member months for all plans in the state market risk pool.
<b>State Average Actuarial Value (AV)</b>	<p>The state average AV is calculated as the summed products of AV and billable member months for the plans within the state market risk pool divided by the total billable member months within the state market risk pool. AV corresponds with metal and catastrophic tiers as follows:</p> <ul style="list-style-type: none"> <li>• Catastrophic: 0.57</li> <li>• Bronze: 0.60</li> <li>• Silver: 0.70</li> <li>• Gold: 0.80</li> <li>• Platinum: 0.90</li> </ul>
<b>State Average Induced Demand Factor (IDF)</b>	<p>The state average IDF is calculated as the summed products of IDF and billable member months for the plans within the state market risk pool divided by the total billable member months within the state market risk pool. IDF corresponds with metal and catastrophic tiers as follows:</p> <ul style="list-style-type: none"> <li>• Catastrophic: 1.00</li> <li>• Bronze: 1.00</li> <li>• Silver: 1.03</li> <li>• Gold: 1.08</li> <li>• Platinum: 1.15</li> </ul>
<b>Billable Member Months</b>	Billable member months are the member months of an individual or family policy that are included when setting the policy's premium rate.

## V. HHS-operated Risk Adjustment Geographic Cost Factor (GCF) – Appendix B

The purpose of the geographic cost factor (GCF) adjustment is to remove differences in premium caused by allowable geographic rating variations. GCFs are calculated for each rating area established by the state under 45 C.F.R. § 147.102(b).

The GCFs are calculated based on the observed average silver plan premium for the metal-level risk pool (calculated separately for individual and small group if the state does not have a merged market) or catastrophic plan premium for the catastrophic risk pool, in a geographic area relative to the statewide average silver or catastrophic plan premium. Calculation of the GCF involves three steps. First, the average premium is computed for each silver or catastrophic plan, as applicable, in each rating area (using the same formula that is used to compute plan premiums in the statewide average premium calculation). The second step is to generate a set of plan average premiums that standardizes the premiums for age rating. Plan premiums are standardized for age by dividing the average plan premium by the plan rating factor (calculated at the rating area level), the enrollment-weighted rating factor applied to all billable members. Lastly, a GCF is computed for each rating area. The GCF is simply the ratio of the enrollment-weighted average age-standardized premium revenue for a rating area to the overall statewide enrollment-weighted average age-standardized premium revenue for all silver plans. The enrollment-weighted statewide average of plan GCF values will equal 1.0, so the GCF can be interpreted as the percentage by which any geographic area’s costs deviate from the state average.<sup>9</sup>

Appendix B is provided in Excel format as a separate link.

---

<sup>9</sup> A GCF of zero indicates no silver plans in the rating area. In final risk adjustment calculations, a GCF of zero will have an imputed value of one.
